Jul 1, 2012 - Maxresdefault. Complexity and collaboration. This paper explores the emergent properties of networks in the light of complexity, and underlines the importance of collaboration. Complexity theory has significant impacts on the ways people conceptualise themselves and their environments. In this paper, we discuss some of the complex conditions that exist and affect the lives of people with chronic conditions, and we explore how their professional and social networks are used to maintain and enhance their wellbeing. Using case studies, we demonstrate the ways that people who live with chronic conditions in Australia are supported and challenged by their social networks. We then show how complexity theory and complexity management can help us understand the meanings people make, and what actions and environments help them retain their well-being and control. A broad theory of complexity based on the work of Charles Eisenstein and others is applied to understand the ways that people with chronic conditions collaborate to manage daily demands, and articulate the social difficulties they face. As we live in a world that is increasingly complex, understanding the social and emotional aspects of the day-to-day life of people with chronic conditions, and being open to what we do not know is essential to being able to support people with chronic conditions and their social networks effectively. Differential effects of D1 dopamine receptor agonists on cocaine-induced behavioral sensitization in rats: the role of NMDA receptors. The D1 dopamine receptor agonists SKF-38393 and (+)-SKF-82957 were examined for their ability to reverse cocaine-induced behavioral sensitization in rats. Moreover, the role of NMDA receptors in mediating the development of D1 agonist-induced disruptions in cocaine-induced sensitization was explored. Direct injections of SKF-38393 and (+)-SKF-82957 into the nucleus accumbens (0.5 microgram) during the onset, but not the maintenance phase, of cocaine (10 mg/kg)-induced behavioral sensitization disrupted the development of this phenomenon. The same dose of SKF-38393 did not block the expression of cocaine-induced sensitization. The NMDA receptor antagonist D-AP5 prevented the disruption of

cocaine-induced sensitization by SKF-38393, but not (+)-SKF-82957, during the onset of sensitization. In contrast, the NMDA receptor antagonist MK-801 blocked the disruption of cocaine-induced sensitization by (+)-SKF-82957, but not SKF-f678ea9f9e
